Functions Of One Complex Variable II (Graduate Texts In Mathematics, Vol. 159)

Synopsis

This book discusses a variety of problems which are usually treated in a second course on the theory of functions of one complex variable, the level being gauged for graduate students. It treats several topics in geometric function theory as well as potential theory in the plane, covering in particular: conformal equivalence for simply connected regions, conformal equivalence for finitely connected regions, analytic covering maps, de Branges' proof of the Bieberbach conjecture, harmonic functions, Hardy spaces on the disk, potential theory in the plane. A knowledge of integration theory and functional analysis is assumed.

Complex analysis is an old and very important part of mathematics, and it has very important applications in engineering (circuit theory) and pure science (quantum mechanics is formulated in an inherently complex formalism). There are a number of very great and important texts in this area. Ahlfors book has been the greatest textbook for a very long time, and it remains a great and even indispensable text. Berenstein and Gay have a ponderous two volume work that gives stunning insight and a very modern perspective. It is also the very best book for those who hope to transition to the theory of several complex variables. So, it is important, and I would not want to be without BG. BG is ponderous to use as a textbook, unless you have a rigorous graduate course. Carrier, Krook, and Pearson is an important and always useful book for giving insight into how calculations

are really done. Needham is unique in that it gives the greatest insight into the underlying geometric meanings of complex analysis. I find many other texts, even those used at most excellent universities, to be of secondary importance. For me, Conway is the best place to begin, the best place to learn, and always a useful and clear reference. He arranges the curriculum in a very orderly way, in a way that allows real insight all along. His proofs are real proofs. He doesn't leave gaps that a student should not bridge easily, and his proofs are complete. They leave no room for objections. So, the text has complete clarity. Conway gives a full skill set. Carrier Krook and Pearson may get you calculating more quickly and with greater facility, but you will learn the full calculation skill in Conway. Conway is quite complete, but without being as ponderous as BG (still a magnificent book).
